

Confidential Memo: Project Phoenix

Status: Active

Project Lead: Sarah Jenkins, VP of Engineering

Project Overview

Project Phoenix is the internal codename for the complete overhaul of Acme Corp's legacy inventory management system. The goal is to replace the 15-year-old COBOL-based system with a modern, AI-driven predictive supply chain model.

Timeline and Budget

- **Phase 1 (Data Migration):** Completed March 2026.
- **Phase 2 (Model Training):** Currently ongoing. Expected completion by September 2026.
- **Phase 3 (Deployment):** Target launch is November 15, 2026.

The total allocated budget for Project Phoenix is \$4.2 Million, with \$1.8 Million already spent during Phase 1.

Key Risks

The primary risk identified by the steering committee is the data latency between the legacy warehouses in Europe and the new AWS US-East servers. We are currently mitigating this by deploying edge-computing nodes at the European facilities.
