

Acme Corp Infrastructure & Architecture Overview

Last Updated: Q3 2026

Cloud Infrastructure

Our primary cloud provider is Amazon Web Services (AWS), accounting for 85% of our workloads. The remaining 15% of specialized AI workloads are hosted on our on-premise Kalyani server farm, utilizing Nvidia H100 GPUs.

Database Architecture

- **Relational Data:** PostgreSQL hosted via AWS RDS.
- **Document & Vector Storage:** MongoDB Atlas is our primary NoSQL and Vector Database. It currently stores over 2.5 million embedded document chunks for our internal RAG applications.
- **Caching:** Redis cluster for low-latency session management.

Application Layer

The core monolith was successfully deprecated in Q1 2026. We now operate a microservices architecture consisting of 42 active services written primarily in Python (FastAPI) and Go. The frontend ecosystem relies on React and Next.js.
